

## Product Guide - Section Two

### Auto Track Falcon® II/Model ATF-II

While similar in function to the manually operated Falcon® IV End Cutter, Eastman's model ATF-II Auto Track Falcon® offers the labor cost saving advantage of automatic operation. The traversing action of the cutting head is driven by a servo controlled gear motor. Lifters are powered by pneumatic air cylinders. The cutting head may be activated at the control panel or by remote control. The remote control enables the operator to activate the Auto Track Falcon's® cutting cycle when the operator has finished pulling the ply down the table. Blade size is 4" with cutting capacity of 1/2" or 1 1/4" for light compressible material.
